

1      **ABSTRACT OF THE DISCLOSURE**

2            A tail pipe includes a body, two internal fittings and an optional  
3       illuminating assembly. The body has an inner passage and two windows defined  
4       through the body. Each internal fitting is mounted in the inner passage of the  
5       body, and corresponds to one of the windows, and has a side face that faces the  
6       window and a protrusion formed from the side face. The protrusions are received  
7       in the windows and extend partially out of the window. The illuminating  
8       assembly is mounted in the inner passage of the body and has multiple  
9       illuminating members to light the internal fittings to be visible in a dark place.  
10      Therefore, the internal fittings will provide a decoration for the tail pipe to make  
11      that look more attractive and also provide a visible signal to alert someone who  
12      is adjacent to the tail pipe to the danger of being burned.
